

Nova Fiber

Gigabit Internet Onboarding & Signup — Product Case Study

Landing page — symmetric gigabit positioning with live stats and a direct path to availability check.

OVERVIEW

Role: Sole frontend engineer — designed and built the marketing site and signup wizard end-to-end.

Nova Fiber is a fiber internet marketing site paired with a five-step signup wizard — address availability check, plan and add-on selection, install scheduling, and account creation — built to turn browsing into a scheduled installation in one continuous session, instead of a maze of disconnected checkout pages.

PRODUCT AT A GLANCE

5 Steps from address to confirmed install	15 min Quoted self-install time in the flow	3 Symmetric speed tiers offered
--	--	--

TECH STACK

- React 19 + TypeScript, built on Vite 8
- Tailwind CSS v4 via the official @tailwindcss/vite plugin
- Framer Motion for page reveals, wizard step transitions, and micro-interactions
- lucide-react for iconography · clsx for conditional class composition
- No backend by design — availability, plans, and scheduling are realistic simulated data driving a fully client-side product showcase

SIGNUP WIZARD FLOW

- **Address** — live availability check against an entered address, with a simulated scan state before confirming fiber is live and the max speed available.
- **Plan** — three symmetric speed tiers with a highlighted most-popular plan, plus optional add-ons (mesh WiFi, static IP, SecureNet).
- **Schedule** — self-install (ships next day, ~15 minutes) or a free professional visit, with date and time-slot pickers that appear only when relevant.
- **Account** — name, email, phone, and password, validated live before the final step unlocks.
- **Done** — an order-confirmation summary with a generated order number, plan, address, schedule, and email, mirroring a real ISP checkout.

DESIGN APPROACH

Dark UI with an aqua-to-violet gradient accent against a subtle animated grid background, positioning Nova as a modern, no-nonsense alternative to legacy cable ISPs. The wizard reuses the marketing site's visual language (same gradients, same card treatment) so the transition from landing page to checkout never feels like leaving the site.

ENGINEERING NOTES

The wizard is a single component tree with lifted state, not a routed multi-page flow — every step reads and writes the same state object, which keeps the final confirmation screen trivially consistent with whatever was selected earlier.

IMPLEMENTATION DETAILS

- **Per-step validation gates the Continue button** — a single derived array (one boolean per step) drives whether the wizard can advance, so adding or reordering steps means touching one array, not scattered conditionals.
- **Direction-aware transitions** — Framer Motion's `AnimatePresence` tracks whether the visitor moved forward or backward through the wizard and slides the next step in from the correct side.
- **Conditional scheduling UI** — the date and time-slot pickers only mount when 'Professional install' is selected, keeping the self-install path to a single tap.
- **Simulated availability check** — the address step uses a timed state transition to mimic an async backend lookup, so the interaction feels real without requiring one.
- **Generated order confirmation** — the final step computes a plan + add-on total and a randomized order number entirely client-side, producing a believable checkout receipt with zero backend.
